BASELINE SECURITY SOLUTIONS LLC

Baseline Rewind

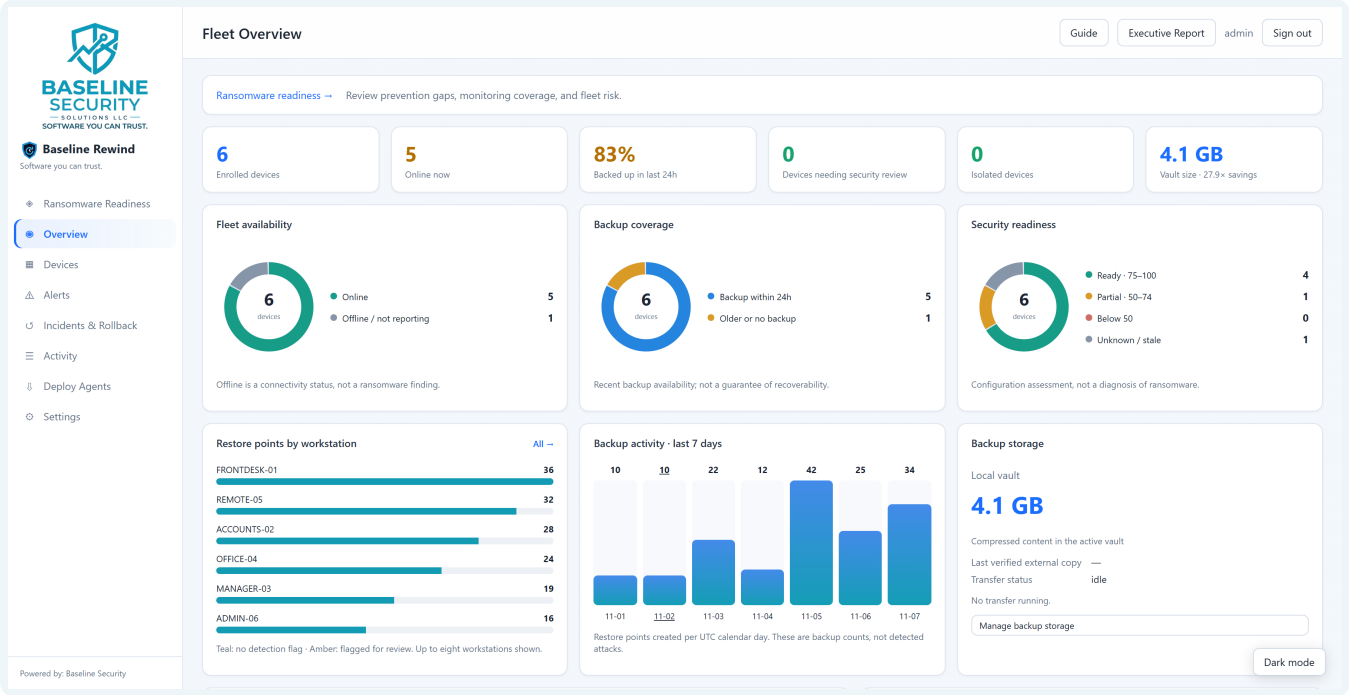

Software you can trust.

CREDIT UNIONS & BANKS

Protect the branch. Prepare for recovery.

Bring workstation ransomware response into your operational resilience program.

Ransomware on branch and back-office workstations can disrupt document access, lending workflows, and member or customer service. Recovery needs a defined process and usable evidence, not a scramble to locate yesterday's files.

Actual light-mode Overview. All workstation data and metrics are fictional, not performance benchmarks.

WHAT YOUR IT TEAM CAN DO

Prioritize the riskiest devices. Readiness, threat signals, stale assessments, and weighted fleet risk help focus technician attention.

Contain affected endpoints. Critical policy can isolate workstations and pause backups, with shared evidence and recovery operations in one console.

Recover selected business data. Protect selected Windows files with a central vault that endpoint agents cannot overwrite or delete; restore from a chosen point with SHA-256 verification. Coordinate a fleet plan using a common incident start time.

Support oversight. Executive reports, device-level technical detail, and command history help explain recovery actions and outstanding gaps.

COMPLIANCE & CONTINUITY

GLBA-based safeguards call for protection of customer/member information; FFIEC continuity guidance emphasizes resilience. Rewind supports selected backup, response, recovery, and documentation tasks within those programs. Institutions still need risk assessments, access controls, vendor oversight, tested continuity plans, and applicable incident notifications. [1,2,3]

NEXT STEP

Run a branch recovery exercise: identify critical workstation files, verify a clean restore, and document the results for management.

Scope: Rewind restores protected files, not Windows or hosted applications, and does not remove malware or stop data theft. Protect the server, use HTTPS and storage encryption, and retain separate offline/immutable backups. Compliance depends on your complete program and applicable requirements. Rewind does not restore core-banking platforms, validate transaction integrity, or automate regulatory incident reporting.
